FEATURES

- Ultra-wide 12:1 input voltage range: 14 -160VDC
- High efficiency up to 90%
- Reinforced insulation, I/O isolation test voltage 3k VAC
- Operating ambient temperature range -40℃ to +105℃
- Active hold-up control, programmable input under-voltage control
- Input reverse polarity protection, Input under-voltage protection, output over-voltage, over-current, short-circuit protection, over-temperature protection
- Industry standard 1/4-Brick package
- Design to meet AREMA standards
- Design to meet UL62368 standards

The UWTH1D_QB-100W(H/F)R3 series is a high-performance product specifically designed for a variety of railway applications. The output power can reach at 100W. It features wide input voltage of 14-160VDC, which is compatible with nominal input type of 24V, 48V, 72V, 96V and 110V. Meets EN50155 standard for voltage fluctuations. The reinforced high insulation 3000VAC ensures that the system can still be used safely in 5000m high altitude applications. The allowable operating temperature is up to 105° C. It integrates multiple protection functions to ensure the safety and high reliability of the system, with functions of remote control and compensation, output voltage adjustment, etc., which perfectly matches the requirements of line loss and special voltage in the application. It is widely used in vehicle-mounted switches, train control systems and associated equipment.

Selection Guide

Note:
①Use "F/H" suffix for heat sink mounting. We recommend to choose modules with a heat sink for enhanced heat dissipation and applications with extreme temperature requirements;
②Exceeding the maximum input voltage may cause permanent damage;
③Efficiency is tested at nominal voltage and full load at +25℃ ambient;
④When UWTH1D_QB-100W(H/F)R3 series products input voltage is 14V~16.8V, the converter can work 100ms at full load.

Remote Sense Application

1. Remote Sense Connection if not used

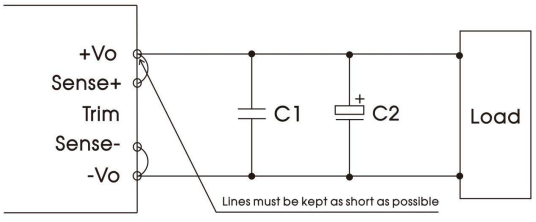

Fig.1

Notes：
(1) If the sense function is not used for remote regulation the user must connect the +Sense to +Vo and -Sense to -Vo.
(2) The connections between Sense lines and their respective power lines must be kept as short as possible, otherwise they may be picking up noise, interference and/or causing unstable operation of the power module.

2. Remote Sense Connection used for Compensation

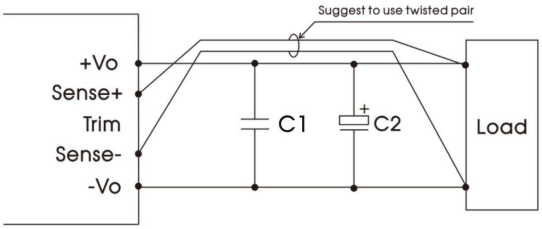

Fig.2

Notes:
(1) Using remote sense with long wires may cause unstable output, please contact technical support if long wires must be used.
(2) PCB-tracks or cables/wires for Remote Sense must be kept as short as possible. Twisted pair or shielded pairs are suggested for remote compensation and must be kept as short as possible.
(3) We recommend using adequate cross section for PCB-track layout and/or cables to connect the power supply module to the load in order to keep the voltage drop below 0.3V and to make sure the power supply's output voltage remains within the specified range.
(4) Note that large wire impedance may cause oscillation of the output voltage and/or increased ripple. Consult technical support or factory for further advice of sense operation.

2. Typical application

1. Mornsun EMC circuit is recommended, otherwise please ensure that at least a 100μF electrolytic capacitors is connected at the input in order to ensure adequate voltage surge suppression and protection.
2. Output ripple can be further reduced by appropriately increasing the output capacitor values C3 and/or by selecting capacitors with a low ESR (equivalent series resistance). Also make sure that the capacitance is not exceeding the specified max. capacitance load value of the product.
3. The UVLO pin can adjust the point of input under-voltage protection by the external resistance RUVLO. Please refer to Fig.9 for the value of RUVLO, if the pin is left open, the under-voltage protection point is 11V.
4. Ctrl current-mode logic recommended circuit design refer to fig.4.

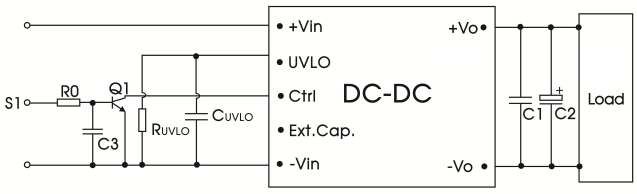

Fig.4

Components	Value	Recommended Component
R0	10K	--
C3	0.1μF	voltage⩾25V
Q1	Ic⩾10mA	voltage⩾30V
Note: S1 pin open, DC-DC ON.		

3. Trim Function for Output Voltage Adjustment (open if unused)

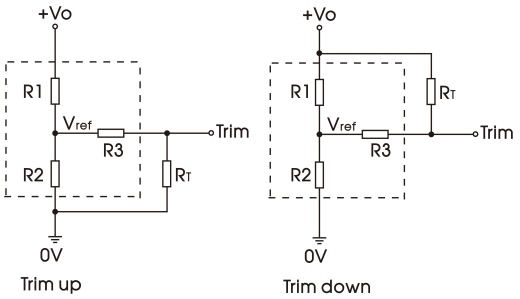

Fig.5
Trim resistor connection (dashed line shows internal resistor network)

Calculation formula of Trim resistance:

$$\text{Trim up}: R_T = \frac{a * R_2}{R_2 - a} - R_3 \qquad a = \frac{2.5 * R_1}{Vo - 2.5}$$

$$\text{Trim down}: R_T = \frac{b * R_1}{R_1 - b} - R_3 \qquad b = \frac{(Vo - 2.5) * R_2}{2.5}$$

Note:
a , b: self-defined parameter, round to the nearest hundredth
R_T(kΩ): Resistance of Trim.
Vo: Output voltage change.
V_{ref}(VDC): Reference voltage.

Vo / Res	12(VDC)	15(VDC)	24(VDC)	28(VDC)	48(VDC)	54(VDC)
R1(KΩ)	11	14.35	24.8	28.8	54	61
R2(KΩ)	2.87	2.87	2.87	2.87	2.94	2.94
R3(KΩ)	20.2	20.2	23.1	23.1	18.2	18.2

Practical Example trim up -10% for 12V output:

$$b = \frac{(10.8 - 2.5) * 2.87}{2.5} = 9.53$$

$$R_T = \frac{9.53 * 11}{11 - 9.53} - 20.2 = 51.113K\Omega$$

R_T according to E24≈51 kΩ

Practical Example trim up +10% for 12V output:

$$a = \frac{2.5 * 11}{13.2 - 2.5} = 2.57$$

$$R_T = \frac{2.57 * 2.87}{2.87 - 2.57} - 20.2 = 4.386K\Omega$$

R_T according to E24≈4.3kΩ

4. EMC compliance circuit

1. The anti-reverse connection circuit is composed of a circuit breaker and a diode D1. The withstand voltage of the diode D1 must be greater than 250V;

2. The EMC filter part is composed of modular circuits. Please refer to Figure 6 for recommended circuits and parameters. Self-built circuits can also be used;

3. Resistor RUVLO is used to adjust the input under-voltage protection point. Refer to Figure 9 for the value.

5. Hold-up time setup capacitor

Fig.7 Recommended circuit and PCB layout for hold-up time

The hold-up time capacitor CExt. Cap is used to hold the output when the input power off.
Note:
1. If there is no requirement for the hold-up time, no additional capacitor CExt. Cap is required;
2. For the hold-up time of 10ms and 30ms, please refer to table blow;
3. Vq is Start-up voltage.

6. Recommended circuit for multi-module parallel redundant design

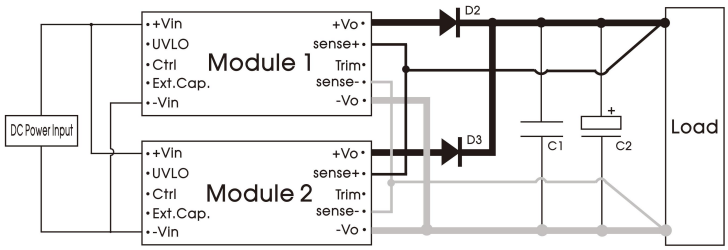

Fig.8

Note:

1. The function of capacitor C1, C2 is filtering. It is used for margin design and cannot be used to increase power;

2. The diodes D2 and D3 are used to protect the power module. In actual use, the user can choose the parameters of the diode or MOSFET according to the output current;

3. Because the output impedance of the two modules is different, the output power of each module cannot be guaranteed to be equal; Pload = P1 + P2 <Pmax (100W).

7. UVLO Function and R_{UVLO} Values

The products with an ultra-wide input voltage range, covering a variety of nominal input voltages. Set the input under-voltage point adjustable function for different input systems, connect a resistor between UVLO pin and -Vin, adjust the under-voltage point of the product by adjusting the resistor value.

$$R_{UVLO} = \frac{182 * c}{182 - c} - 20 \qquad c = \frac{1272.35}{V_{shutdown} - 6.45}$$

Note:
c: self-defined parameter.
R_{UVLO}(KΩ): UVLO setup resistance.
$V_{shutdown}$: UVLO shutdown voltage.
